PATHWAY: PROTEIN BIOSYNTHESIS.

SIMILARITY: BELONGS TO THE ELONGATION FACTOR P FAMILY.
                                                                                         O J. 9:2701-2708(1990).
FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.
THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC
MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE
SORTING OF HETEROGENEOUS CELL TYPES. N-CADHERIN MAY BE INVOLVED I
NEURONAL RECOGNITION MECHANISM.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: INVOLVED IN PEPTIDE BOND SYNTHESIS. STIMULATE EFFICIENT TRANSLATION AND PEPTIDE-BOND SYNTHESIS ON NAMIVE OR RECONSTITUTED 70S RIBOSOMES IN VITRO. PROBABLY FUNCTIONS INDIRECTLY BY ALTERING THE AFFINITY OF THE RIBOSOME FOR AMINOACYL-TRNA, THUS INCREASING THEIR REACTIVITY AS ACCEPTORS FOR PEPTIDYL TRANSFERASE (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BB0214;

"Expression of XBCad, a novel cadherin, during oogenesis and early development of XBCad, a novel cadherin, during oogenesis and early development of XBCad, a novel cadherin, during oogenesis and early development of XBCad, in The STATE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

"I- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

"I- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT IN A HOMOPHILIC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE SORTING OF HETEROGENEOUS CELL TYPES.

SORTING OF HETEROGENEOUS CELL TYPES.

"I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

"I- TISSUE SPECIFICITY: EXPRESSED IN PITUITARY GLAND, LUNG AND KIDNEY.

"I- DEVELOPMENTAL STAGE: DURING OOGENESIS AND EARLY DEVELOPMENT.

"SIMILARITY: BELONGS TO THE CADHERIN FAMILY.

C -!- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

C -!- FUNCTION: CADHERINS MAY THUS CONTRIBUTE TO THE

C MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE

C SORTING OF HETEROGENEOUS CELL TYPES. N-CADHERIN MAY BE INVOLVED IN

C NEURONAL RECOGNITION MECHANISM.

C -!- SUBCELLULAR. LOCATION: TYPE I MEMBRANE PROTEIN.

C -!- SUBCELLULAR. LOCATION: TYPE I MEMBRANE PROTEIN.

Statistics: Mean 25.449; Variance 30.607; scale 0.831

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 19.257; Variance 58.572; scale 0.329

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC A microparticle preparation (MP) has been developed, consisting of CC A microparticles having a diameter of less than 100 mu m. The MP comprises: CC microparticles having a diameter of less than 100 mu m. The MP comprises: CC a) a polymeric matrix (PM) consisting of one or more synthetic polymers CC having a solubility in water of less that 1 mg/l; and (b) an expression CC vector selected from RNA molecules (at least 50% of which are closed CC circles) or circular plasmid DNA (at least 50% of which are supercolled). CC Also described is a MP of at most 20 microns in diameter, comprising: (a) CC also described is a MP of at most 20 microns in diameter, comprising: (b) CC Inked to a coding sequence, where the coding sequence encodes an	Synthetic. Claim 1; Page 40; 58pp; English.

Chaim 1; Page 40; 58pp; English.

Ceither an isolated human non-collagen or non-myslin basic protein

(MBP) polypeptide which is capable of tolerising an individual to an

autoantigen; or an isolated human pathogen polypeptide capable of

tolerising an individual to that polypeptide. In both cases, the

polypeptide (whether self or non-self) includes an amino acid

sequence corresponding to a sequence motif for a MHC class II

sequence corresponding to a sequence with a human autoimmune

clisease and which binds to the polypeptide to activate autoreactive

Totelis, such as HIA-DR, which is associated with a human autoimmune

darived from the human desmoglein a protein (amino acids 206-220)

and is implicated as a self epitope in pemphigus vulgaris. Peptides

common 15 an.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Guery Match

PS Disclosure; Column 4; 42pp; English.

CC The patent describes a new preparation of microparticles each

CC comprising a polymeric matrix and a nucleic acid. The polymeric

cc matrix consists of one or more synthetic polymers having a solubility

CC in water of less than 1 mg/l (e.g. poly-lactic-co-glycolic acid);

CC and at least 90% of the microparticles have a diameter of less than

CC 100 microns. The microparticles are useful for the delivery of nucleic

CC acids to phagocytic cells. In one embodiment the microparticles are

CC less than 20 microns in diameter and the nucleic acid (preferably in

CC closed circular form) includes an expression control sequence

CC of the coding sequence is a polypeptide having a length and a sequence

CC which permits it to bind to an MHC class I or II molecule. The

CC expression product is thus an effective stimulator of an immune

CC response in mammals. The present sequence, an antigenic portion of

CC desmoglain 3, is an example of an MHC class II peptide which can be

CC expressed by the nucleic acid. It is associated with pemphigus

CC converse.

                                                                                                                                                                                                                                                                                            Fused protein recognised by pemphigus vulgaris auto:antibody useful to treat and diagnose pemphis vulgaris claim 1; Page 7-9; 9pp; Japanese.
W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgCl hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pemphigus vulgaris antigen protein extracellular region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   용
                                                                                                                     remphigus foliaceus antigen-IgG constant region fusion protein - linked through the hinge region used to treat pemphigus foliaceus Claim 1; Page 10-12; 17pp; Japanese.

This sequence represents a fused protein recognised by pemphigus foliaceus the constant region of pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is especially administered through an adsorbent upon which the fusion useful for detecting pemphigus foliaceus antibodies which is useful in immunocalignosis. The fusion protein has little or no side effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.

Asparagine synthetase AS1.
asparagine synthetase; transgenic plant; herbicide resistance;
asparagine synthetase; nitrogen fixation; pea:
                                                                                                                                                                                                                                                                                                                                                                                                                            transgenic plants
Disclosure; Fig 2B; 9lpp; English.
Disclosure; Fig 2B; 9lpp; English.
The DNA sequence encoding this protein was isolated from cDNA clones selected from a pea nodule cDNA library from the "Sparkle" variety of P.sativum. Pea ASI CDNA was used as a probe.
The protein is produced by expression vectors containing the AS2 coding sequence. Recombinant AS can be used to engineer herbicide resistance, as a dominant selectable marker, to select novel
                                                                                                                                                                                                                                                                                                                                          A comparison of pea AS and human AS polypeptides reveals homology of 47% at the amino acid level, c.f. 86% between AS2. There are several regions of high local homology (g. 80%) shared between the pea AS and human AS polypeptides see also Q06598, Q06622 and Q06623.

TRESULT PROPERTY OF THE SULT P
Claim 12; Page 407; 483pp; English.

Chis sequence represents a Streptococcus pneumoniae protein that, based to nomology with an Escherichia coli protein, is a aspartate ammonia con industrial sequence of the invention.

Classe, and is encoded by a DNA sequence of the invention.

Classe, and is encoded by a DNA sequence of the invention of the invention can be used to identify compounds which interact with and continuous pneumoniae proteins. Antagonists can be used to identify compounds which interact with and continuous to a tivate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic confinibit or activate the activity of the proteins. Antagonists can be considered to induce an immunological response confinition in they can also be used to induce an immunological response coffine encoding nucleic acids in a vector adequate to produce antibody cand/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Disclosure; Fig 2A; 91pp; English.
The DNA sequence encoding this protein was isolated from cDNA clones selected from a pea nodule cDNA library from the "Sparkle" variety of P. sativum. Human AS cDNA was used as a probe.
The protein is produced by expression vectors containing the AS1 coding sequence. Recombinant AS can be used to engineer herbicide resistance, as a dominant selectable marker, to select novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WO9013633-A.

RESOLT ID WILL ACC WI

Segment of desmosomal cadherin, desmoglein Dsg2.
Desmosomal cadherin; desmoglein; Dsg2; cell; surface;
carcinoma; desmosome; antibody; epitope; diagnosis; de
micrometastasis; separation; enrichment; targetted del

micrometastasis; metastatic.

                                                                                                                                             Prolynucleotide(s) encoding human protocadherins pc3 and pc4 and rat profit involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell adhesion and regulation activities pc5 - fivolved in cell-cell adhesion and regulation activities pc5 - fivolved in cell-cell sc1 adhesion and postess for three protocadherins. This cc R8685-R86867 represent the sequences for three protocadherins are crelated to cadherin, and possess cell adhesive ability. Cadherins are composed of an N-terminal extracellular domain cathesion. Cadherins are composed of an N-terminal extracellular domain continuous continuous continuous and continuous and continuous continuous catherins and other cytoplasmic domain interacts with the cytoplasmic domain. The cytoplasmic domain interacts with the cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the cadherins, but in those which possess it, it is essential for the cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. The continuous well and 2 (see T03575 and continuous c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

CC The present sequence is a segment of the desmosomal cadherin (DC), CC desmoglein Dsg2, which is exposed on the surface of epithelial or CC arcinoma cells and not bound to desmosomes. An antibody (Ab) CC directed against epitopes of the present sequence can be used to CC diagnose, i.e. to detect carcinoma cells, especially micrometastases, not bound to desmosomes. An antibody and CC as a therapeutic to deliver agents, e.g. other Ab or toxins, to CC target cells. The Ab provides rapid and reliable detection of CC metastatic carcinoma, and detects parts of DC that are not accessible in desmosome bound cells, as in normal tissue or
                                                                                                                                                                                                     Antibody reactive with part of desmosomal cadherin - exposed on surface of epithelial or carcinoma cells, not bound to desmosomes, yeseful for diagnosis and treatment of carcinoma micrometastases of claim 7; Page 5; 8pp; German.

The present sequence is a segment of the desmosomal cadherin (DC), desmoglein Dsg2, which is exposed on the surface of epithelial or carcinoma cells and not bound to desmosomes. An antibody (Ab) directed against epitopes of the present sequence can be used to directed against epitopes of the present sequence can be used to diagnose, i.e. to detect carcinoma cells, especially micrometastases, not bound to desmosomes to separate, enrich or detect living or fixed carcinoma cells by cell sorting methods and as a therapeutic to deliver agents, e.g. other Ab or toxins, to metastatic carcinoma, and detects parts of DC that are not accessible in desmosome bound cells, as in normal tissue or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                              DNA encoding a low affinity interleukin-12 receptor - used to bind or scavenge IL-12 to cause immune suppression, e.g. to suppress graft-vs-host reaction, and user impression or inflammation, and to treat autoimmune conditions claim 4; Page 31-33; 61pp; English.

A cDNA library of PHA-activated peripheral blood mononuclear cells in vector PEF-BOS was screened for interleukin-12 (IL-12) receptor cDNAs by panning. One isolated cDNA (083844) encoded a 662-amino acid low affinity IL-12 receptor (R69632). Another cDNA contained an additional 202 bp of 3'UTR; the deduced 660-amino acid sequence contained an additional sequence and the sequence of the s
                                                                                                                                                                                                                                                                                                           (HOFF ) HOFFMANN LA ROCHE Chizzonite RA, Chua AO, WPI; 95-076349/11.
                                                                                                                                                                                                                                                                                                                                                                            08-JUL-1994; 110657.

(HOFF ) HOFFMANN LA ROCHE & Chizzonite RA, Chua AO, G
                                   DNA encoding a low affinity interleukin-12 receptor - used to bind or scavenge IL-12 to cause immune suppression, e.g. to suppress graft-vs-host reaction, allograft rejection or inflammation, and to treat autoimmune conditions Claim 4; Page 24-27; Slpp; English.

A cDNA library of PHA-activated peripheral blood mononuclear cells in vector pEF-BOS was screened for interleukin-12 (IL-12) receptor cDNAs by panning. An isolated cDNA was sequenced (Q83844); it encoded a 662-amino acid low affinity IL-12 receptor (R69632). Recombinant IL-12 receptor was expressed in COS cells, and can be used for therapeutic or diagnostic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         R69632;

       New interleukin-12 beta-2 receptor and high binding affinity complexes - have a high affinity for interleukin-12, and are used to recomplexes - have a high affinity for interleukin-12, and are used to recomplexes - have a high affinity for interleukin-12 (IL-12) receptor beta-1 receptor (W12772) and a low binding affinity for IL-12, but when complexed with an interleukin-12 (IL-12) receptor beta-1 receptor was a complex with a low binding affinity for IL-12. Its amino acid sequence was deduced from a cDNA clone (T59732) obtd. from human lymphoblasts. IL-12 receptor beta-1 can be expressed on the surface of transformed host cells as a complex with co-expressed IL-12 receptor beta-2, and used in therapeutic compsns. pref. with at least 1 cytokine antagonist, to treat autoimmune dysfunctions such as rheumatoid arthritis, inflammatory bowel disease and multiple sclerosis. The receptor protein or complex can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 7; Conser

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 27.020; Variance 36.303; scale 0.744

submitted to the EMBL Data Library, February 1994
The biogenesis of C-type cytochromes in Escherichia coli
requires an integral membrane protein with a protein
disulphide isomerase like domain.
                                                                                                                                                                                                           submitted to the EMBL Data Library, December 1994 The sequence of S. cerevisiae cosmids 9537, 9581, and lambda clone 5898.

This protein is one of a family of glutamine amidotransferases that have dual specificity to utilize either glutamine or ammonia as a substrate. Two functional domains have been identified: an aminator domain, which catalyzes the ammonia-dependent reaction, and a glutamine amide transfer domain, which binds glutamine and transfers the aminator domain.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri Jun 11 17:29:22 1999; MasPar time 2.45 Seconds 172.912 Million cell updates/sec

Tabular output not generated.

Sequence: Description: Perfect Score: >US-08-991-628-4 (1-15) from US08991628.pep 108 1 TPMFLLSRNTGEVRT 15

Scoring table: PAM 150 Gap 15

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 27.687; Variance 32.651; scale 0.848

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
